# Cystoscopy & Evacuation of Blood Clots from the Bladder

The inspection of the bladder and urethra with a telescope and removal of clots with suction —occasionally bladder biopsy or removal of abnormal areas with the use of a heat diathermy

---

This patient information leaflet is drawn from the consensus panels of many worldwide urological societies, as a supplement to any advice that you may already have been given. Alternative treatments are outlined below and can be discussed in more detail with Dr Campbell.

---

## What are the alternatives to this procedure?

Open surgery, observation, incision of the narrowing.

## Before the procedure

Please be sure to inform Dr Campbell in advance of your procedure if you have any of the following:

- ~ An artificial heart valve
- ~ A coronary artery stent
- ~ A heart pacemaker or defibrillator
- ~ An artificial blood vessel graft
- ~ A neurosurgical shunt
- ~ Any other implanted foreign body
- ~ Blood thinning medications, particularly
  - ~ Asasantin
  - ~ Aspirin
  - ~ Fish oil
  - ~ Iscover
  - ~ Persantin
  - ~ Plavix
  - ~ Warfarin
- ~ Mesh hernia repair
- ~ Previous abdominal surgery
- ~ Angina
- ~ Hypertension
- ~ Diabetes
- ~ Recent heart attack

You will usually be admitted on the day of surgery, although many patients requiring this procedure have already been admitted as an emergency.

You may be asked to attend a pre-admission clinic 5–10 days before the procedure to assess your general fitness and to perform some baseline investigations.

If you are taking warfarin, Clopidogrel, iscover, asaantin, or persantin on a regular basis, you must discuss this with Dr Campbell because these drugs can cause increased bleeding after surgery. There may be a balance of risk where stopping them will reduce the chances of bleeding but this can result in increased clotting, which may also carry a risk to your health. This will, therefore, need careful discussion with regard to risks and benefits.

You will be asked not to eat or drink for 6 hours before surgery. Immediately before the operation, you may be given a pre-medication by the anaesthetist which will make you dry-mouthed and pleasantly sleepy.

After admission, you will be seen by members of the urological team which may include not only Dr Campbell, but the specialist registrar, the intern, and your named nurse. The specialist registrar may perform the operation in conjunction with Dr Campbell and with your permission

## Where do I go for my procedure?

The admissions section of the hospital at the appointed time, on the appointed day. The admissions section of the particular hospital will give you instructions well in advance of the operation. If no contact has been made telephone Dr Campbell's secretary on (07) 3367 1608, and the problem will be addressed.

## Cystoscopy & Evacuation of Blood Clots from the Bladder continued...

---

### Do I need to do anything special before my procedure?

You will need to not drink or eat anything for 6 hours prior to the procedure.

### During the procedure

Either a full general anaesthetic (where you will be asleep throughout the procedure) or a spinal anaesthetic (where you are awake but unable to feel anything from the waist down) will be used. Both methods minimize pain; your anaesthetist will explain the pros and cons of each type of anaesthetic to you.

You will usually be given injectable antibiotics before the procedure, after checking for any allergies. A telescope is inserted through the water pipe (urethra) to inspect both the urethra itself and the whole lining of the bladder. Blood clots are removed using suction through the telescope. Once the bladder is free of clots, it may then be possible to identify the cause of any bleeding and, if appropriate, this will be treated at the same time.

The operation takes approximately 30–60 minutes.

### Immediately after the procedure

After the procedure, a catheter will normally be inserted into the bladder to allow irrigation of fluids and prevent further formation of blood clots. Once your urine is clear, the catheter will be removed. You will normally be allowed home once you have passed urine satisfactorily.

The average hospital stay is 5 days.

### Are there any side-effects?

Most procedures have a potential for side-effects and these are outlined below. Please use the check circles to tick off individual items when you are happy that they have been discussed to your satisfaction:

#### **Common (greater than 1 in 10)**

~ Mild burning or bleeding on passing urine for short period after operation  
Temporary insertion of a catheter

#### **Occasional (between 1 in 10 & 1 in 50)**

~ Infection of the bladder requiring antibiotics  
~ Finding of cancer or other abnormalities may require further surgery or other therapies  
~ Permission for telescopic removal/ biopsy of bladder abnormality/stone if found

#### **Rare (less than 1 in 50)**

~ Further bleeding requiring removal of clots or further surgery  
~ Injury to the urethra causing delayed scar formation  
~ Very rarely, perforation of the bladder requiring a temporary urinary catheter or open surgical repair

### General side-effects of any procedure

Any operative procedure that involves regional (spinal) or general anaesthetic can have side-effects. These are explained in the leaflet on anaesthesia.

#### **Hospital-acquired infection**

~ Colonisation with MRSA (0.9%, 1 in 110)  
~ Clostridium difficile bowel infection (0.2%; 1 in 500)  
~ MRSA bloodstream infection (0.08%; 1 in 1,250)

(These rates may be greater in high-risk patients e.g. with long-term drainage tubes, after removal of the bladder for cancer, after previous infections, after prolonged hospitalisation or after multiple admissions)

### What should I expect when I get home?

When you get home, you should drink twice as much fluid as you would normally for the next 24–48 hours to flush your system through. You may find that, when you first pass urine, it stings or burns slightly and it may be lightly bloodstained.

When you leave hospital, a discharge summary of your admission will be sent to your family doctor. This holds important information about your inpatient stay and your operation.

---

### What else should I look out for?

If you develop a fever, severe pain on passing urine, inability to pass urine or worsening bleeding, you should contact Dr Campbell immediately.

For after hours emergencies Dr Campbell can be contacted on (07) 3367 1608.

The Wesley Hospital Emergency Centre (07) 3232 7333, and The Greenslopes Private Hospital Emergency Centre (07) 3394 7111 are other resources that are also available

### Are there any other specific points?

A follow-up appointment may be required following discharge from hospital and may involve an outpatient clinic appointment, drug therapy or further urological treatment, depending on the cause of your bleeding.

### Is there any research being carried out in this field?

There is no specific research in this area at the moment but all operative procedures performed are subject to rigorous audit at monthly Audit & Clinical Governance meetings.

### Who can I contact for more help or information?

#### **Dr Peter Campbell**
